

Day 17 - Notes

Agentforce, AI Agents & Enterprise AI Systems

1. Agentforce & AI Agents (Basics)

- **Agentforce** is Salesforce's framework for building AI-powered agents.
- AI agents are not normal chatbots — they are **intelligent systems that can think + act**.
- They understand user requests, analyze data, and execute actions automatically.

Key Idea

Traditional systems → user clicks everything

AI agents → system understands and does tasks automatically

2. What AI Agents Do in Enterprises

AI agents can:

- Understand natural language input
- Access enterprise data (CRM, records, etc.)
- Make decisions using reasoning
- Trigger workflows automatically
- Perform business actions

Example

User: "Show pending student fees"

AI Agent: Fetch data → check database → display results

3. AI Workflow in Enterprise Systems

Flow of Execution

User Query → AI Agent → Flow / Apex → Database → Response → Action

Meaning of Each Step

- **AI Agent** → Understands user request
 - **Flow** → Handles simple automation (no code)
 - **Apex** → Handles complex logic (code)
 - **Database** → Stores and retrieves data
 - **Response** → Output shown to user
 - **Action** → Updates or triggers system changes
-

4. AI Integration with Salesforce (Flow + Apex)

- AI does not work alone.
- It connects with:
 - **Flow (automation tool)**
 - **Apex (programming logic)**
 - **Database (records)**

Result

AI becomes a “decision layer” on top of enterprise systems.

5. AI Agent Use Cases

College Management

- Attendance tracking assistant
- Course recommendation system
- Exam schedule reminders

Placements

- Resume screening AI
- Interview preparation assistant
- Job matching system

Recruitment

- Candidate shortlisting AI
- Interview scheduling assistant
- Skill matching system

Student Support

- Doubt solving assistant
- Fee reminder system
- Academic guidance bot

Faculty Operations

- Timetable generator
 - Auto grading assistant
 - Workload balancing system
-

6. Risks of AI Systems

AI in enterprises is powerful but risky.

Main Risks

- **Hallucinations** → AI gives wrong answers
 - **Wrong automation** → incorrect actions triggered
 - **Privacy issues** → sensitive data exposure
 - **Bias** → unfair decisions
 - **Incorrect approvals** → wrong approvals in workflows
 - **Over-automation** → too much dependency on AI
-

7. Why Guardrails are Important

Enterprises must control AI using:

- Approval systems (human verification)
- Data access restrictions

- Logging and monitoring
- Role-based permissions
- Safety rules for actions

Without guardrails, AI can cause business failures.

8. Future of AI in Enterprise Software

- Software will become **AI-driven instead of user-driven**
- Developers will focus less on manual coding
- More focus on:
 - Designing workflows
 - Controlling AI behavior
 - Setting rules and limits

Big Change

Old way → write code for every step

New way → AI decides steps + executes them

9. Key Concepts to Remember

- Agentforce = AI agent platform in Salesforce
 - AI agents = intelligent decision + action systems
 - Flow = no-code automation
 - Apex = backend logic
 - AI needs enterprise data to work properly
 - Guardrails are necessary for safety
-

10. Final Summary

AI agents are transforming enterprise systems into intelligent platforms that can understand users, make decisions, and execute business workflows automatically.

However, they must be carefully controlled using rules, permissions, and validations to avoid incorrect or risky actions.
